If is_local() takes a relatively long time to execute, then you don't want to call it when knows_python() has already returned True.This is called lazy evaluation, or short-circuit evaluation.By default, or evaluates conditions lazily, whereas any does not. In the above example, the program wouldn't even need to determine if Susan is local because it already confirmed that she knows Python.

How to Use any() in Python – Real Python

Visual Studio Code (VS Code) is a free and open-source IDE created by Microsoft that can be used for Python development. You can add extensions to create a Python development environment as per your need in VS code. It provides features such as intelligent code completion, linting for potential errors, debugging, unit testing and so on.
