Effective perfusion requires an optimal interplay between vascular volume and vasomotor tone. In the critical care setting, the blood volume and/or the vasomotor tone may be subject to rapid changes, and a patient may enter the critical care unit with preexisting disturbances resulting from trauma, disease, or pharmacologic treatment.

Use of inotropes in critical care CO = HR \u00b7 SV The SV depends on the SVR (afterload) and the " preload ". Preload (the degree to which ventricles are stretched before contracting) correlates with the end diastolic volume (the volume of blood in a ventricle at the end of filling). It is important to optimise preload by

Use of inotropes in critical care

members of the UKCPA Critical Care Group. Since then it has become a widely used information source in UK hospital pharmacies. It is, as far as I am aware, the only document of its type in existence. The majority of the information on minimum volumes cannot be supported except by the anecdotal experiences of the contributing pharmacists.

Perhaps the best-known example of a care bundle in use throughout most intensive care units in the developed world is the sepsis care bundle, based on the Surviving Sepsis campaign. 6 This collaborative international campaign promotes information through its website and through publication of recommendations in the major critical care journals. This initiative has been widely criticized ...

Gastric residual volume (GRV) is considered a surrogate parameter of GI dysfunction during the progression of enteral feeding in the early phase of critical illness and beyond. By monitoring GRV, clinicians may detect patients with delayed gastric emptying earlier and intervene with strategies that minimize or prevent VAP as one of the major risks of EN.
