Water and other fluids play a vital role in the processes that shape the earth's crust, possibly even influencing earthquakes and volcanism. Fluids affect the movement of chemicals and heat in the crust, and they are the major factor in the formation of hydrothermal ore deposits. Yet, fluids have been overlooked in many geologic investigations.

The extracellular fluid can be further divided into interstitial fluid, plasma, lymph, cerebrospinal fluid, and milk (in mammals). Extracellular fluids bathe the cells and conduct nutrients, cells, and waste products throughout the tissues of the body. Mature red blood cells, white blood cells, and platelets lie in a nearly colourless, protein-rich liquid called plasma.

In a solid, shear stress is a function of strain, but in a fluid, shear stress is a function of strain rate. A consequence of this behavior is Pascal's law which describes the role of pressure in characterizing a fluid's state.. Depending on the relationship between shear stress, and the rate of strain and its derivatives, fluids can be characterized as one of the following:

Fluid and Electrolyte Balance. The kidneys are essential for regulating the volume and composition of bodily fluids. This page outlines key regulatory systems involving the kidneys for controlling volume, sodium and potassium concentrations, and the pH of bodily fluids. Intravenous Fluids and Renal Failure

Normal cellular function requires that the intracellular composition of ions, small molecules, water, pH, and a host of other substances be maintained within a narrow range. This is accomplished by the transport of many substances and water into and out of the cell with the use of membrane transport proteins as described in Chapter 1.

If the idea of having to drink lots of cups of water a day doesn't appeal, don't worry – fluids include fresh water and all other liquids, such as milk, coffee, tea, soup, juice and even soft drinks. Fresh water is the best drink because it does not contain energy (kilojoules) and is best for hydrating the body.

The fluid responsible for hydrothermal REE redistribution is preserved in fluid inclusions in the quartz lenses. The bulk of the quartz lacks fluid inclusions but is cut by two later hydrothermal quartz generations, both containing sulfate-rich fluid inclusions with sulfate often present as multiple trapped solids, as well as in solution.
