Secondary Bone Cancer | Cancer Council Victoria

There are two main types of secondary bone cancer: Osteolytic – In this type, bone is broken down without new bone being made. In some cases, holes form in the bone. These... Osteoblastic – In this type, new bone is formed in some areas, but it grows abnormally. These areas are called...

Secondary Bone Cancer | Cancer Council NSW

For instance, breast cancer that has spread to the lungs is called "metastatic breast cancer to the lungs" – it's not lung cancer. Treatment is also based on where the cancer started. If prostate cancer spreads to the bones, it's still prostate cancer (not bone cancer), and the doctor will choose treatments that have been shown to help against metastatic prostate cancer.

Understanding Advanced and Metastatic Cancer

Secondary bone cancer may cause increased amounts of calcium to be released from the bone into your blood. A raised level of calcium in the blood is called hypercalcaemia. Hypercalcaemia may show up on a routine blood test. But it can also cause symptoms which may include:

Symptoms of secondary bone cancer - Macmillan Cancer Support

• Secondary (metastatic) bone cancer – means that the cancer started in another part of the body (e.g. breast or lung) and has spread to the bones. See our fact sheet on secondary bone cancer.

Understanding Primary Bone Cancer

Secondary breast cancer can be controlled, often for many years, but it cannot be cured. Because of new and improved treatments, women with secondary breast cancer are living for longer. The aim of treatment is to control the cancer, improve the symptoms and help you to live well for longer. The treatment you have will depend on:
